

CANCERVIVE: Data Visualization of Cancer Survival and Treatment Recommendation

Problem Statement

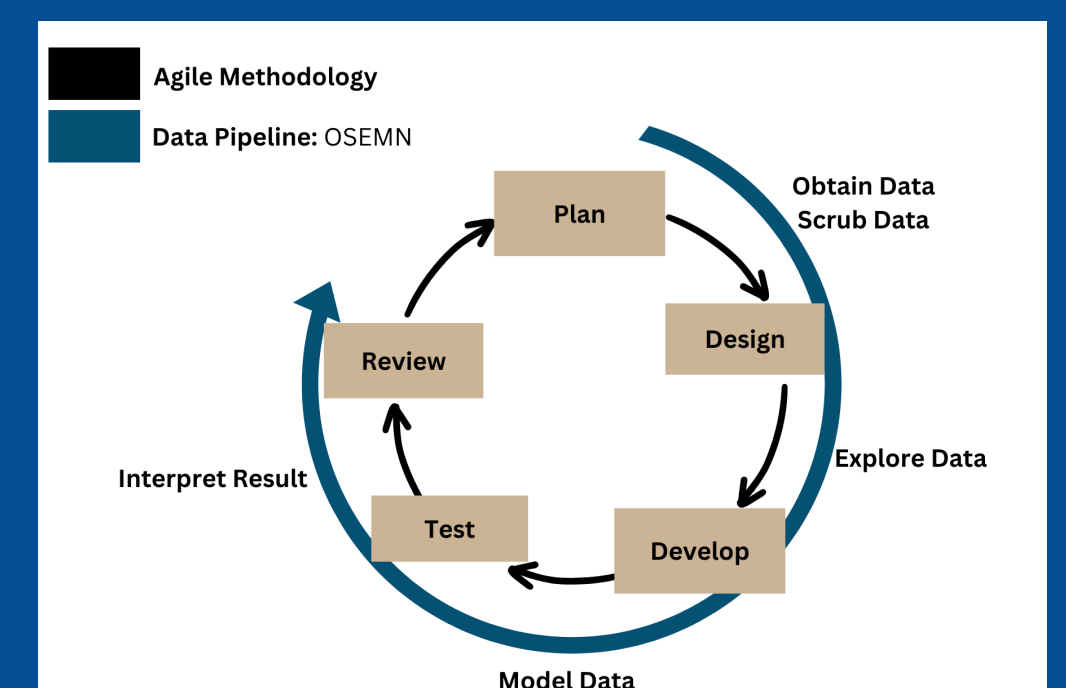

- Doctors or oncologists have difficulty accessing cancer survival and treatment data due to limitations in obtaining the most recent cancer data.
- Doctors or Oncologists use to predict a patient's survival rate by looking at information from similar patients, such as those with the same type and stage of cancer.
- Doctors or oncologists have problems to analyze data, predicting cancer survival rates, and planning treatment accurately.

Objectives

- To identify the system requirement for CANCERVIVE: Data Visualization of Cancer Survival and Treatment Recommendation dashboard.
- To design a dashboard for CANCERVIVE: Data Visualization of Cancer Survival and Treatment Recommendation.
- To develop a dashboard for CANCERVIVE: Data visualization of cancer survival and treatment recommendation.

Methodology

CANCERVIVE dashboard development and report documentation were guided by Agile methodology, while the OSEM framework was used to manage and process cancer survival and treatment data.

Agile Methodology +
OSEMN Framework

System Features

- Visualize Cancer Survival Rate Analysis.
- Interactive Dashboard.
- Data Filtering.
- Predict Cancer Survival Rate.
- Treatment Recommendation.

User Feedback

- The average SUS score for the CANCERVIVE system is 74.32%, indicating that the system is in the good rating category.
- The score indicates high user satisfaction and usability, reflecting effective design and user-friendliness.

Conclusion

Limitation

- The data is from year 2015-2019.
- The system predictive model is based on machine learning data only.
- The system can only support and function in desktop mode.

Future Work

- Obtain datasets from Malaysia.
- The system is compatible with mobile devices and tablets.
- Collaboration with oncologist experts.
- Collaboration with Malaysia Minister of Health
